Corporate Headquarters

Quality with Integrity

Founded in 1988, Hicool is a leading manufacturer of motors, fans and blowers serving diverse markets and covering the entire scope of air moving technology and thermal solutions.

Our highly skilled team are driven every single day to create tailor-made solutions for complex applications in different industries. Our engineers are passionate about working very closely with our customers to meet their exact requirements in the most cost-effective way.

By having full control of our process chain, we are able to deliver unrivalled quality products with superior lifespans and reliability.

Hicool products enhance operational efficiency, save energy and improve customer product and equipment lifetime by providing the desired amount of temperature control.

With 2 state of the art manufacturing facilities and a yearly capacity of over 15 million motors we are able to cater to the rising demand of climate and temperature control products.

Do contact us for tailor-made solutions for your needs.

Selecting The Right Fan

In recent years, the importance of cooling technology has become even greater due to an increase in heat emitted by equipment in line with a transition to high functionality and high speed. Therefore, selection of a right cooling fan for the application have become even more critical.

Based on the application, below parameters need to be determined for the right selection of the fan:

Fan Type

Airflow

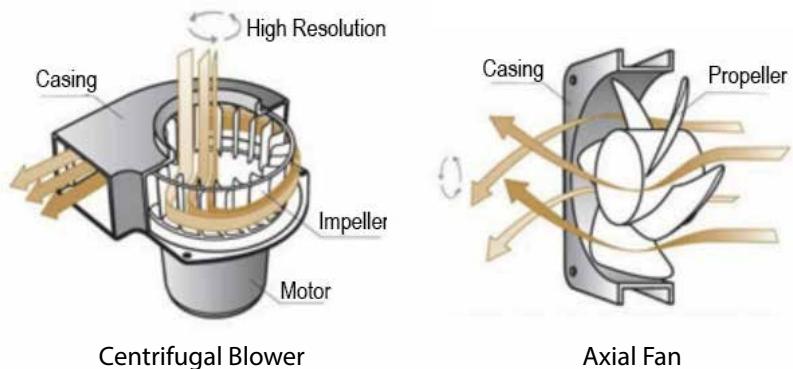

Static Pressure

Atmospheric Condition

Ingress Protection

Fan Type

Fans are generally categorized by the way the air enters and leaves the fan; if it exits in the same plane as it enters it is normally termed an axial fan, as to draw air in from one side and expel it from the other. If the airflow leaves in a different plane it is normally referred to as a centrifugal design, as the air drawn in changes direction inside the fan and is expelled in a different direction. Axial fans are predominantly suitable for high airflow in systems with low static pressure, while centrifugal fans offer lower airflow against higher static pressure.

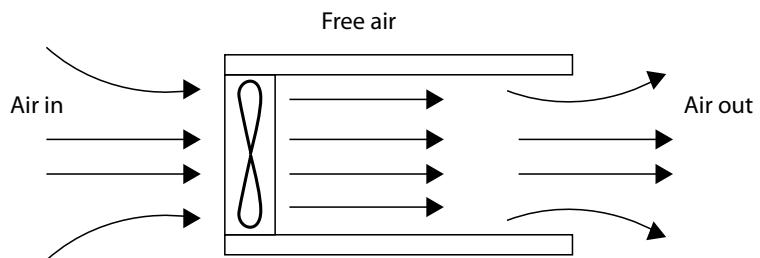

Airflow

Once the fan type is known, the volume of air exchanged must be determined. Airflow is rated in cubic feet of air per minute (CFM) or in metric equivalent, it is rated in cubic meters per hour (M³/hr).

$$1 \text{ CFM} = 1.699 \text{ M}^3/\text{hr}$$

Lower airflow will affect the cooling of equipment; therefore, it is always recommended to select a fan with airflow that is slightly higher than required.

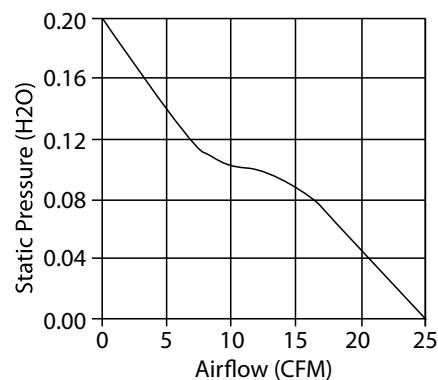

Static Pressure

An accurate measurement of static pressure is critical for proper fan selection. Static Pressure is the resistance to airflow (friction) caused by the air moving through a pipe, duct, hose, filter etc. Static Pressure is rated in inches water gauge (inWG) or the metric equivalent, millimeters water gauge (mmWG).

$$1 \text{ inWG} = 25.4 \text{ mmWG}$$

The airflow given in our catalogue is at free air i.e. at 0 static pressure. Please ask for Airflow vs Static Pressure Chart before selecting a Fan.

Atmospheric Condition

Apart from the above parameters while selecting a fan also consider the Atmospheric Condition near the fan. A fan should be operated within the operating temperature range given in the spec sheet. Fan should be selected based on the application (i.e. whether outdoor or indoor, dusty atmosphere etc). For dusty atmosphere it is always recommended to go for a fan with at least IP 44 protection and for outdoor application where the fan is exposed to the environment higher IP rating is required.

GUIDELINE FOR SELECTING A FAN

How to select the correct fan?

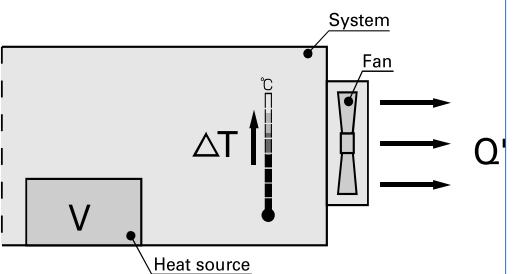

1. Determine your system specifications & condition:

Determine the rise in temperature inside the system and obtain the total value of heat based on its input & output.

Example:

V – Total value of heat in your system = 200 W

ΔT – Temperature rise inside your system = 15 K

2. Airflow calculation for cooling your system :

Once the system specifications & conditions are determined, calculate the required airflow to cool the system using below mentioned formula.

Example :

Q' - Motion airflow (m³/min)

$$Q' = V / (20 \times \Delta T) \text{ i.e } 200 / (20 \times 15) = 0.66 \text{ m}^3/\text{min.}$$

Note : The formula shown above only applies when the heat radiation is performed only by cooling air from the fan.

3. Fan selection:

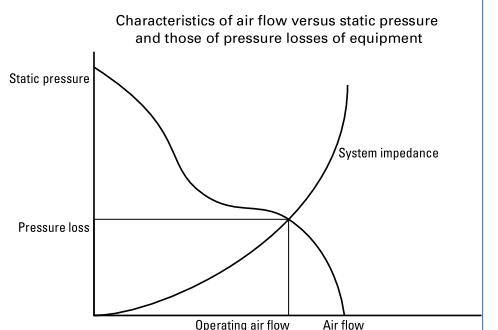

The Cooling Fan is selected based on the value obtained by calculating the motion airflow (Q').

-Note that, the motion airflow when the Cooling Fan is mounted in your system can be obtained using the airflow Vs static pressure characteristic curve and system impedance.

- As the system impedance cannot be measured without a measuring instrument, so fan with 1.5 to 2 times higher airflow than the actual maximum airflow should be selected.

(Note: operating airflow is one third to two third of maximum airflow)

-The fan selected should be such that, it should satisfy the airflow requirement along with the available space within your system.

4. Finalize the selected fan :

Calculate the temperature rise inside your system when your system is having 100 W of total heating value is forcefully cooled by the fan selected by you.

Example :

$$Q' = Q \times 2/3 = 0.66 \times 2/3 = 0.44 \text{ m}^3/\text{min}$$

$$\Delta T = V / (20 \times Q') = 200 / (20 \times 0.44) = 22.72 \text{ K}$$

Therefore, the temperature rise in your system is 22.72 K.

Note that, the value obtained from above equation is rough value, final fan selection should be based on your actual installation test.

What is Ingress Protection

Ingress protection ratings or IP ratings, refer to the level of protection offered by an electrical enclosure, against solids and liquids.

SOLIDS

1

Protected against a solid object greater than 50mm such as hand

2

Protected against a solid object greater than 12.5mm such as finger

3

Protected against a solid object greater than 2.5mm such as a screw-driver

4

Protected against a solid object greater than 1mm such as a wire

5

Dust protected, limited ingress of dust permitted. Will not interfere with operation of the equipment. Two to eight hours

6

Dust tight, no ingress of dust. Two to eight hours

1

WATER

Protected against vertically falling drop of water. Limited ingress permitted. Duration 10 minutes

2

Protected against vertically falling drops of water with Fan tilted up to 15 degrees from the vertical. Duration 10 minutes, shall have no harmful effect.

3

Protected against sprays of water up to 60 degrees from the vertical. Duration 5 minutes, shall have no harmful effect.

4

Protected against water splashed from all directions. Duration 5 minutes, shall have no harmful effect.

5

Protected against jets of water. Duration 3 minutes, shall have no harmful effect.

6

Water projected from powerful source shall not enter the enclosure in harmful effect.

7

Protection against the effects of immersion in water between 15cm and 1 meter for 30 minutes

8

Protection against the effects of immersion in water under pressure for long periods

IP Ratings Explained

E.g. IP 4 4

The first digit (4) represents the protection against solid objects and the second number (4), against water

from UL's Recognized Component Mark
Marks. The Recognized Component Mark is
gments or under "Markings" for the individualal features or restricted in performance
te equipment submitted for investigation rather
ance of the component is dependent upon its

and scope of UL. For questions, please

Only those products bearing the UL Certification Mark should be considered as being covered by UL's
Certification and Follow-Up Service.The UL Recognition Component Mark generally consists of the manufacturer's identification and catalog
number, model name, or other product designation as specified under "Marking" for the particular
Recognition as published in the appropriate UL Directory. As a supplementary means of identifying products
that have been produced under UL's Component Recognition Program, UL's Recognized Component Mark:
■ may be used in conjunction with the required Recognized Marks. The Recognized Component Mark is
required when specified in the UL Directory preceding the recognitions or under "Markings" for the individual
recognitions.Recognized components are incomplete in certain constructional features or restricted in performance
capabilities and are intended for use as components of complete equipment submitted for investigation rather
than for direct separate installation in the field. The final acceptance of the component is dependent upon its
installation and use in complete equipment submitted to UL LLC.

Look for the UL Certification Mark on the product.

B. M. Muthukrishna, Director North American Certification Program
UL LLCAny information and documentation involving UL Mark services are provided on behalf of UL LLC (UL) or any authorized licensee of UL. For questions, please
contact a local UL Customer Service Representative at www.ul.com.
